

Paste As File 2.1.4.0- By Chris Gingerich

Paste As File is an app to paste the contents of the clipboard to a new file in the current folder via the context menu windows explorer background.

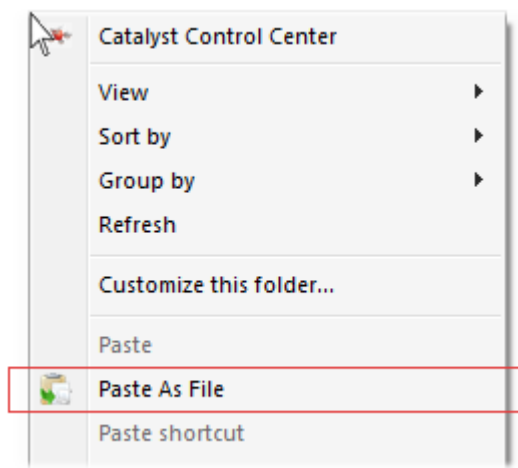

Supports saving to the image formats **jpg, pcx, png, bmp, tga, gif and tif.**

Plain text format **txt** (you can also use other plain text extensions such as HTML, CSS and more)

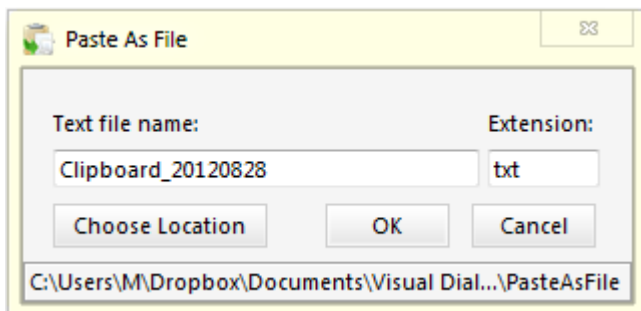

RTF File support needed to be removed for now as there was an issue with the RTF control on some systems causing crashing and duplicate processes.

To use:

Double click the Paste As File.exe file and select install. This will install Paste As File and add a **Paste As File** menu item to the folder context menu of windows explorer background.

Then when you copy any text or image to the clipboard, just right click on a windows explorer background, your desktop or right on a folder (for use on Windows XP) and select **Paste As File**. Based on the clipboard contents, you will be asked to save a TEXT (.txt) file or an image in format based on the extension you give the file. You can save text to any plain text file type such as HTML, PHP, and CSS just to name a few. Just change the extension!

Since Windows XP does not have an easy way to add context menu items to the desktop and folder background like Vista and above does, I had to add the menu item to the context menu of the folders. So in Windows XP, right click on a folder and choose Paste As File.
